

Quarterly Platform Brief — Q3 Summary

The platform team spent the quarter on the queue. Two lanes replaced the single one, and a person pressing a button no longer waits behind an hour of timers. Nothing else about the queue changed. The dashboard now says how many runs are ahead of the one being waited on, and says it in the queue lane the run actually sits in rather than in total.

Retrieval moved less. The model is the one it was, the chunk budget is the one it was, and the only number that moved was the cap on how many results one document may contribute to an answer. That cap is per document and not per source, which is the distinction the previous release got wrong and the reason two answers looked identical.
